

PRODUCT DESCRIPTION & PHASE 1 BLUEPRINT

MindSparkle

Chat-first AI study companion that turns documents into summaries, quizzes, presentations, guides, and study packs — built natively on Anna.

1. What is MindSparkle?

MindSparkle is an AI-powered learning application designed for students and professionals who study from large documents. Instead of jumping between tools, users open one chat-first workspace, upload material, and instantly generate learning outputs through focused modes.

Phase 1 rebuilds MindSparkle as an **Anna App** to reduce infrastructure cost, reach Anna Marketplace users quickly, and qualify for the Founding Builder Program through real traction.

2. Why this product matters

- **Too many documents, too little retention.** Learners collect PDFs but struggle to convert them into practice.
- **Chat alone is not enough.** Users need structured modes: summarize, quiz, present, guide, study.
- **Cost blocked the old stack.** The previous MindSparkle backend (Supabase + Cloud Run + AI APIs) became expensive while the product was paused.
- **Anna unlocks distribution + runtime.** Build once, list in Marketplace, use Anna LLM/storage, grow with grants tied to MAU.

3. Phase 1 user experience

When the app opens, users land in a clean chat (similar to modern AI workspaces). A side rail with dots expands into a sidebar containing the core learning modes.

Summarize	Condenses documents into clear, structured overviews.
Quiz	Generates practice questions to test understanding.
Presentation	Creates slide-ready outlines from the same source material.
Guide	Builds a step-by-step learning path through the content.
Study	Produces key concepts and revision-friendly study notes.

Core flow: Upload/paste document → choose mode → get output in chat/result panel → ask follow-up questions.

4. Frontend plan (Anna UI bundle)

- Chat canvas as the home screen (welcome + history + composer + attach).
- Collapsed side rail (dots) that expands into mode sidebar.
- Active mode highlighting and mode-specific result cards.
- Loading / empty / error states that feel polished for Marketplace review.
- No secrets in the frontend — all AI calls via Anna host APIs / tools.

5. Backend plan (Anna-native, low cost)

Phase 1 does **not** migrate the old Supabase/Cloud Run system. Instead we use Anna platform primitives:

- **LLM sampling / llm.complete** — generate summaries, quizzes, slides, guides, study notes.
- **Upload + files + APS storage** — keep documents and outputs per user without your own DB bill.
- **Executa tools** — summarize_document, generate_quiz, generate_presentation, generate_guide, generate_study_notes.

This keeps monthly cost low while the product finds users on Anna Marketplace.

6. What ships in Phase 1 vs later

Phase 1 (now)	Later phases
Chat + 5 modes Document upload Save recent results Marketplace listing	Deeper memory Advanced quiz types Video / labs Monetization experiments

7. Marketplace & Founding Builder positioning

One-liner: MindSparkle turns any study document into summaries, quizzes, presentations, guides, and study packs — inside a chat-first Anna App.

Category angle: Education / Productivity / AI Study Tools.

Success signal: installs + users completing at least one learning mode.

Funding path: join Anna Founding Builder and grow MAU tier by tier.

8. Recommended build order

1. Scaffold Anna App (`anna-app init mindsparkle`).
2. Ship chat shell + side rail UI.
3. Ship Summarize end-to-end first.
4. Add Quiz, Study, Guide, Presentation.
5. Polish listing/screenshots → validate → publish → submit review → release.
